

30 Animals That Made Us Smarter By rapo88.org For the curious and scientific minded detailed descriptions abound such as how the study of a cow's digestion through four stomachs has inspired a filtration system to provide safe drinking water:

lots of interesting facts about natural inspiration for technological advances well worth the money for a curious person. 1785947508 Based on the BBC podcast about humans inspired to solve technical engineering and other problems through the study of animals and their distinctive adaptations. Packed with amazing and fascinating animal facts such as it takes baby elephants at least one year to learn to use their trunks it's a boon for the animal lover: While each chapter contains a detailed drawing of the animal it's features and sometimes the inspired end result the drawings and accompanying notes are too small for the page. I would have enjoyed a color photograph of the "multicoloured dazzler" a peacock mantis shrimp over the lengthy description provided. Also I was surprised to find inconsistent references to the inspired humans - Dr, Frank Fish was referred to as Professor Frank Fish Frank Fish and Frank: The author is clearly passionate about the natural world and the humans inspired by it. Overall the book is encouraging inspiring and educational. His enthusiasm is infectious. 1785947508 \$11.53 shipping 30 Animals That Made Us Smarter.
