

I'm not familiar with the history of computational poetics so I found this book interesting on a number of levels: the code the resulting poems the flexibility of language how the appendix situates these works in multiple different historical contexts. **Travesty Generator bookkeeping** 75 print (list(combinations(I can't breathe)))-----MemoryError Traceback (most recent call last)---//three_last_words 75 really brilliant poetry collection that uses code to generate poems. **Travesty generatorlink** if i could sum up the thesis of the project in one question it would seem to be "how many different ways do i need to say this for you to understand?" 75 Poetry.
